MOTOMICO FARM & HOME

MOLE KILLER

MIMICS A MOLE'S NATURAL FOOD SOURCE, THE GRUB

27MG-5

MOTOMCO FARM & HOME

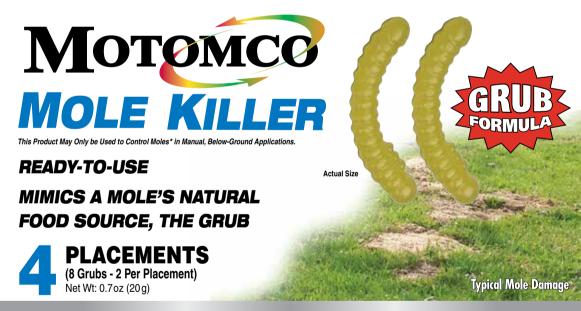

Other mole baits have been developed on the premise that moles are similar to rats and mice, when in reality moles are insectivores (insect eaters). Moles readily consume earthworms, and when available, grubs. In fact, more than 90% of a mole's average dietary requirements are from earthworms and grubs.

Thousands of hours of groundbreaking laboratory and field research have gone into the product you are holding. Motomco Mole Killer has been carefully designed to mimic a mole's most common natural food source - earthworms and grubs. Moles may consume a lethal dose in a single feeding, but it may take two or more days from the time of bait consumption for moles to die.

Scientifically designed and tested to mimic a mole's natural food source. Moles may consume a lethal dose in a single feeding, but it may take two or more days from the time of bait consumption for moles to die.

- Kills Moles
- ✓ Ready To Use
- Effective against most common mole species

Contains the nerve poison Bromethalin. This is not an anticoagulant type rodenticide. For humans or animals ingesting bait and/or showing poisoning signs (such as muscle tremors, loss of hind limb use, or seizures for animals), limit absorption by either emesis or gastric lavage. Sublethal symptoms, if present, would be the result of cerebral edema and should be treated accordingly through administration of an osmotic diuretic and corticosteroid.

TREATMENT FOR PET POISONING
If an animal eats bait, call veterinarian or 1-877-854-2494 at once. NOTE TO PHYSICIAN OR VETERINARIAN

IMPORTANT: Do not expose children to this product or use it for any purpose other than to control moles. To help prevent accidents:

1. Store product not in use in locations out of the reach of children and pets.

To bait deep tunnels, drop two MOTOMCO MOLE KILLER grubs (one placement) through the probe hole, using the probe to push the bait completely into the tunnel. Cover the hole with a piece of sod, a small rock or a piece of newspaper to allow for visual inspection. Repeat bait application every 5 to 10 feet of each active deep tunnel and within 5 feet of each active conical mound. Check for the

Environmental Hazards

when This product is extremely toxic to mammals and birds. Dogs and other predatory and scavenging mammals and birds might be poisoned if they feed upon animals that have eaten this bait. Do not apply directly to water.

emove and place grub shaped bait according to use directions below and ADDITIONAL GRAPHICS AND TEXT.

SUBSURFACE RUNWAYS: MOTOMCO MOLE KILLER has been specially designed to mimic the natural food sources of the mole. To achieve maximum effect, MOTOMCO MOLE KILLER should only be placed in areas used habitually by moles for feeding.

ESTABLISHING INITIAL ACTIVITY: Use your finger, small wooden dowel or a narrow rod to puncture a hole in the top of subsurface runways. Be careful not to crush runways. Mark opened runways and revisit them 48 to 72 hours later. Runways that have had holes resealed within 72 hours should be baited.

of subsurface runways. Be careful not to crush nunways. Mark opened runways and revisit them 48 to 72 hours later. Runways that have had holes resealed within 72 hours should be bailed.

BAITING ACTIVE RUNWAYS. Make a hole in the top of the runway with a rod slightly larger than the diameter of the bat. Drop two grubs (one placement) into the runway, using the rod to push any exposed bail completely into the runway. Carefully reseal the runway with a small amount of dirt to exclude light. Repeat bait application every 5 to 10 feet of each active subsurface runway.

WARRANTY: To the extent consistent with applicable larger than the diameter of the bat. The properties of the runway of the runway

DETERMINING BAITING RESULTS: Five (5) to 7 days after belt application, check for mole activity using the same procedure for determining initial activity. Return 48 to 72 hours later and retreat all active runs.

MAIN UNDERGROUND TUNNELS AND CONICAL MOUNDS: Moles construct deeper tunnels that are not visible from the surface. These deep tunnels systems are often marked by a series of conical mounds (piles of dirt) 4 to 12 inches high such use and/or handling are contrary to label instructions.
